Biomaterial Selection

All biomaterials selected by Grace Medical, Inc. meet or exceed ASTM and international standards for implant grade materials. Current implant material choices include:

Hydroxylapatite - This biomaterial is among the most biocompatible materials available for use. Its structure is essentially calcium and phosphorous resembling the chemical composition of bone. Implant materials used by Grace Medical, Inc. are dense hydroxylapatite with minimum porosity.

Otosil - Otosil is a combination of silicone and barium sulfate. The barium sulfate adds rigidity to the silicone while still providing elastic properties. Because barium sulfate is a radio-contrast agent, it is helpful for determining the position of the implant by x-ray. OtoSil shafts can be trimmed using a scalpel.

Nitinol - As Heat-Activated Shape Memory - Nitinol is typically composed of approximately 50% to 55.6% nickel by weight in proportion to the titanium content. Nitinol is a non-ferromagnetic material with a lower magnetic susceptibility than stainless steel. When heat is applied to the Nitinol wire causing it to reach its transition temperature, it remembers and returns to its formed shape.

Nitinol - As Superelastic Shape Memory - Same material only treated differently. There is no transition temperature using superelastic nitinol. The wire is formulated to gain a spring-like character. Superelastic nitinol exerts forces to remain closed.

PTFE (polytetrafluoroethylene) - Frequently referred to as TEFLON® or fluoroplastic (FLPL) - this highly inert material is widely used for implant applications. Its properties are well suited for tympanostomy tubes due to its “slick” characteristics that may help limit clogging of tube lumens.

*Teflon is a registered trademark of the E.I. DuPont de Nemours and Co., Wilmington, D.E.

Silicone - This time proven biomaterial has excellent properties for ventilation tubes and middle ear implant application. Tubes can be “squeezed” with forceps allowing for compact insertion of the tube yet retaining its original preformed shape once securely in place. Firm durometer (hardness) silicone is used for implant shaft materials due to its stiffness and inert properties.

Phosphorylcholine - PC is a totally synthetic, stable polymer coating that develops a covalent molecular water layer on the material surface. These molecules bind themselves tightly, making it difficult for proteins and cells to displace the water and attach to the surface of the ventilation tube. PC coating applied to silicone ventilation tubes helps to enhance resistance to bacterial infection.

Titanium - ASTM F67 Grade 2 Titanium is a lightweight, highly biocompatible material that has found increasing application replacing stainless steel. It is very lightweight and non-reactive to MRI.

Polyethylene - Polyethylene, which is composed of only carbon and hydrogen atoms, is a popular implant material used in a variety of microsurgery applications. Bioinertness and the ability to have smooth surfaces are but a few of the qualities that make polyethylene appropriate for ventilation tubes.

Customer Orders
